

# Ethical AI

## Why Ethical AI?

AI has brought numerous benefits to our lives - including in health care, data processing, all aspects of business and so on. With all the benefits came a lot of risks! If used in non-ethical manner such as for purposes such as disinformation, deception, human abuse, or political suppression, AI can result in serious negative impact on individuals, environment and the society. Organization implementing as well using AI to deliver product and service needs to adhere to the ethical principles.

many rules, protocols and standards are being developed to ensure AI is developed and used in an ethical way. Some of those are discussed here....

## Australia's AI Ethics Principles

- **Human, societal and environmental wellbeing:** AI systems should benefit individuals, society and the environment.
- **Human-centred values:** AI systems should respect human rights, diversity, and the autonomy of individuals.
- **Fairness:** AI systems should be inclusive and accessible, and should not involve or result in unfair discrimination against individuals, communities or groups.
- **Privacy protection and security:** AI systems should respect and uphold privacy rights and data protection, and ensure the security of data.
- **Reliability and safety:** AI systems should reliably operate in accordance with their intended purpose.
- **Transparency and explainability:** There should be transparency and responsible disclosure so people can understand when they are being significantly impacted by AI, and can find out when an AI system is engaging with them.
- **Contestability:** When an AI system significantly impacts a person, community, group or environment, there should be a timely process to allow people to challenge the use or outcomes of the AI system.
- **Accountability:** People responsible for the different phases of the AI system lifecycle should be identifiable and accountable for the outcomes of the AI systems, and human oversight of AI systems should be enabled.

The **Belmont Report** [↗\(https://www.hhs.gov/ohrp/sites/default/files/the-belmont-report-508c\\_FINAL.pdf\)](https://www.hhs.gov/ohrp/sites/default/files/the-belmont-report-508c_FINAL.pdf) covers ethical protocol in experimental research and algorithmic development. The following principles are very much relevant to AI development:

- Autonomy: Individual autonomy, right to know about potential risks
- No harm: No bias
- Fairness and Equality

**Recommendations from UNESCO** [↗\(https://www.unesco.org/en/artificial-intelligence/recommendation-ethics\)](https://www.unesco.org/en/artificial-intelligence/recommendation-ethics)

Ten principles...

- Proportionality and Do No Harm
- Safety and security
- Fairness and non-discrimination
- Sustainability
- Right to Privacy, and Data Protection
- Human oversight and determination
- Transparency and explainability
- Responsibility and accountability
- Awareness and literacy
- Multi-stakeholder and adaptive governance and collaboration
