

Scrum

Scrum is one of the most popular agile development approaches that is widely used in the industry. This approach suggests smaller incremental development cycles called sprints.

Scrum roles

Core roles:

Product owner: Works as the client representative in the scrum team. Needs to be an expert in scrum, proactive, goal-oriented and have very good communication, negotiation and teamwork skill.

Scrum master: Is the mentor in the team, not a manager. Can be a leader, however, is referred to as a "servant leader". Facilitates scrum process and the meetings within the team. Must be an expert in scrum.

Scrum team: Knowledgeable in scrum. Technical experts who self-organize the teamwork.

Non-core roles:

- clients
- vendors
- other relevant organizations

Scrum values

- Courage: members should have the courage to do the right thing, even if that is not the most convenient
- Focus: focus on sprint work and contributing to the goal
- Commitment: members are committed to delivering good quality work
- Respect: mutual respect within the team, even in case of disagreement
- Openness: Communicate challenges, drawbacks, status and be open to challenges

Scrum principles

- empirical process control
- self organization
- collaboration
- value-based prioritization
- time boxing
- iterative development

Scrum Process

- Initiate: project vision, roles, scrum team, backlog (project specification and requirements)
- Plan and estimate: brainstorm, estimate, sprint backlog
- Implement: sprint, daily stand up, adapt
- Review and retrospect: demonstration, reflection
- Release: handover deliverables

The first phase is the project inception phase. The rest is conducted iteratively to add value.

Discussion: How well are we following the process? Reflection on last semester and adjustments for this semester.
